

# Harried? Hard-pressed for time? On an early-to market schedule?

The IEEE EDS Vanguard Short Course Series gives you the technology connect that you need to design, test, or market your devices and circuits.

On **April 12** in Santa Clara (**April 26**, Taiwan) an affordable one-day, 6-hour short course on **Ultra-Thin Gate Dielectrics** is being offered by the IEEE Electron Devices Society.

Prof. Jack C. Lee from the University of Texas at Austin will focus the **Ultra-Thin Gate Oxide and High-K Dielectrics** short course on topics such as Advanced MOS Gate Stack Structures and:

- Physical and chemical properties of SiO<sub>2</sub> and Si/SiO<sub>2</sub> interface
- Oxide characterization and testing methods
- Pre-oxidation cleaning
- Oxide reliability including breakdown mechanism and lifetime extrapolation
- Oxynitride gate dielectrics
- Effects of process-induced damages (e.g., plasma process)
- High-K gate dielectrics - potential candidates and technology
- Gate electrodes (e.g., polysilicon, metal) and their effects on gate dielectrics.

## THE VANGUARD SERIES

IEEE Electron Devices Society presents a new series of continuing education courses for the experienced engineer who is seeking in-depth information on advanced technologies that complements his or her own knowledge and practice. The modestly priced, one-day courses on leading edge technologies are taught by renowned experts in their fields.

## Available SOON on the web and on videotape!

In 2Q 2001, Vanguard Series short courses will be available via the Web or videotapes -- your choice! These are the full short courses already delivered live, including

**Overview of Fiber Optics and Circuit Designs and Technology for RF-CMOS.**
